he "peculiar institution" of slavery cuts a swath through the heart of American history, with effects lasting long after its abolition by Lincoln's Emancipation Proclamation (1863) and the Thirteenth Amendment to the U.S. Constitution (1865). African slavery on the mainland goes back almost to the beginnings of European settlement and was practiced in all parts of British colonial America. But the division of these former colonies after the Revolution into groups of "free" and "slave" states laid the basis for secession and Civil War (1861-1865), the costliest in American history. The lasting legacies of slavery and Civil War for the South and for African-Americans are still debated in the new millennium, with passions barely diminished by time.

In one sense the statistical record of this history is abundant, though many aspects of slavery's human reality lie beyond the reach of quantitative measurement. The demographic experience of African slaves during the colonial period -- arrivals and population growth -- has been pieced together by scholars from a wide if heterogeneous array of surveys and commercial reports. Beginning with the first federal census of 1790, the slave population may be studied in remarkable geographic detail, by cities and counties as well as states. As the scope of census inquiries expanded in 1840, 1850, and 1860, the surveys of agriculture and manufacturing have formed the primary basis for a flourishing literature on the economics of slavery in the late antebellum period. These sources may be supplemented by others, such as the records of transactions in slaves at leading markets such as New Orleans; probate inventories; and surviving business and plantation accounts. The present volumes present only a small fraction of the full archival record, focused on basic series that convey a sense of the evolution of the institution and the slave population over time.

Slavery and the slave trade in colonial North America

As important as it is for American history, slavery did not originate in the colonies that became the United States, nor did they play a particularly significant role in the transatlantic slave trade. Elaborated systems of slavery existed in ancient Greece and Rome and persisted in medieval Europe, while varieties of slavery were practiced for centuries in Asia, Africa, and the Americas before Columbus. Perhaps a million African slaves were transported to South America on Portuguese and Spanish ships before the

¹ A useful historical reference work on global slavery is Drescher and Engerman 1998.

first "twenty and odd Negroes" arrived in Virginia in 1619. Over the entire history of the trans-Atlantic slave trade, no more than 8 percent of the coerced African migrants came to mainland North America. The much larger U.S. share in the hemispheric slave population of 1860 (approximately 50 percent) is attributable to the very different demographic experience of slaves in North America than elsewhere in the New World.²

By 1619, slavery had been on the decline in England (as elsewhere in western Europe) for centuries. Perhaps for this reason, the legal definition of slavery as perpetual servitude for blacks and their progeny was not fully established in the Chesapeake Bay region until the 1660s. A number of the first generation of African-Americans were regarded as "servants" eligible for freedom after a term of years, by analogy to the indentured laborers who formed the majority of the work force in the Upper South during the seventeenth century. In 1664, however, Maryland declared that all blacks held in the colony, and all those imported as slaves in the future, would serve for life, as would their children and later generations; Virginia's policy became equally clear by the end of that decade.³ Both the practice and the legal definition of slavery became established in relatively similar form throughout English America.

Slavery was not inflicted exclusively on Africans. During the early settlement of South Carolina, for example, Native peoples were frequently captured and sold to planters in the West Indies. With the rise of rice and naval stores as exports after 1700, larger numbers of enslaved Indians were kept in the low country, reaching a peak of roughly 2,000 by 1720.4 In this instance, Indian slavery collapsed through the legislative intervention of the Carolina assembly, fearful of triggering new outbreaks of war with regional tribes. More broadly, the demographic devastation experienced by the Native population made them unsuitable candidates for enslavement (see essay <MS.ESS.02>).

Only at the very end of the seventeenth century did the inflow of African slaves become substantial. As of 1690, blacks constituted less than 15 percent of the population in Virginia and Maryland, reflecting the fact that for the first two generations of Chesapeake tobacco, labor was primarily supplied by white indentured servants (table <JJM.1>). Between 1690 and 1710, the pattern radically changed. Data newly

² Modern quantitative estimation of the volume of the African slave trade begins with Curtin 1969. Extensive subsequent research has largely confirmed the broad patterns initially proposed by Curtin. For a recent summary, see Eltis 2000. Table 1.1. ³ Galenson 1996, p. 165.

⁴ Menard 1996, p. 287.

compiled by Lorena Walsh show that the number of slaves imported into Virginia and Maryland averaged around 750 per year during 1698-1703, then surged to 1500 per year after 1720, remaining high until the American Revolution (table <JJM.4B>).⁵ The shift may also be observed in the composition of colonial populations: in Virginia, the black share rose from 7 percent in 1680 to 30 percent in 1720 (table <JJM.1>). The reasons for this "transition from servants to slaves" have been intensively studied by economic historians.⁶ The primary forces may be identified as: rising scarcity in the supply of servants; improved life expectancy among African-Americans, enhancing their value as slaves for life; and booming demand for Chesapeake tobacco after 1700.

The number of slaves imported into the Lower South colonies of South Carolina and Georgia were not as high, but their share of the population was much larger. South Carolina was more than one-third black in 1690, two-thirds by 1730 (table <JJM.1>). Georgia's expansion was delayed by its designation in 1733 as a debtor's colony within which slavery was prohibited. Slaves quickly flowed into Georgia when the restriction was lifted in 1750, pushing the black share in the population above 40 percent by 1770 (table <JJM.1>). During the years 1768-1772, for which detailed figures of the trade are available, more than 40 percent of all imported slaves went to Georgia (table <JJM.4A>). The contrast in the relative prominence of slavery between the Upper South and the Lower South reflects the adverse health conditions and arduous labor requirements of lowland rice cultivation, whereas tobacco farming continued to be attractive to free family farmers as well as to slaveowners.

Although the slave population was thus highly concentrated in the southern colonies, it is important to note that slavery existed in all of the colonies, persisting until after the Revolution. Thus we find more than 3,000 blacks in Rhode Island in 1748, 9.1 percent of the population; 4,600 blacks in New Jersey in 1745, 7.5 percent of the population; and nearly 20,000 blacks in New York in 1771, 12.2 percent of the population (tables <JJM.3H>, <JJM.3F>, and <JJM.3G>). Most of these blacks are presumed to have been slaves, though the colonial censuses were rarely explicit about status. For an exception, see the 1755 figures for Maryland reported in table <JJM.3C>, which indicate that 99 percent of the 42,061 recorded blacks were slaves, though only 60 percent of the 3,608 mulattos were slaves.

Emancipation measures in the northern states followed in the wake of the Revolution, beginning with Vermont in 1777. But in New York and New Jersey, the struggle to pass an emancipation act was contentious. New York did not do so until 1799; New Jersey not until 1804 (see table <ESW.TAB.01>). Most of the northern emancipations were gradual, often applying only to children and only after lengthy periods of "apprenticeship." Thus, one finds enumerations of Negro slaves in northern states even into the 1840s (table <ESW.A.1>). The most remarkable case of lingering northern slavery was New Jersey, which reported 236 slaves in 1850, and 18 as late as 1860 (series <ESW.A.1.15>).

<ESW.TAB.01>

The demography of slavery in the antebellum South

Despite the protracted character of northern abolition, by the 1790s the country was clearly divided into two sections, one slave and one primarily free, each approximately equal in population and area at the outset. The Northwest Ordinance of 1787 prohibited slavery in the area north of the Ohio River, thus extending the division into the western territories then undergoing rapid settlement. The final step in defining the institutional structure of the era occurred in 1807, when the federal Congress terminated the African slave trade, the Constitutional proscription on interference with the trade having expired. After the final influx of Africans between 1793 and 1807, associated with the emergence of cotton as a major export, the southern states acquiesced in this prohibition. Thus, from this date onward, the growth of the slave population was almost entirely due to natural increase.

Despite this restriction, the slave population grew very rapidly, averaging more than 2 percent per year across the half century prior to the Civil War (tables <MRH.A.10> and <ESW.A.1>). This demographic experience was unique among slave systems in the New World,⁸ and was surely not unrelated to the South's willingness to accede to the cessation of the African trade in 1807. Among many implications of the reliance on natural increase, one may note the strikingly equal gender balance of the slave population (table <MRH.A.12I>). In 1820, male slaves outnumbered females

⁷ The standard account of northern abolition is Zilversmit 1967. For an account of New Jersey, see Hodges 1997.

⁸ Fogel 1989, pp. 114-153.

slightly, at 51.2 percent of the total. By 1840, however, the male and female totals differed by no more than one tenth of one percent. This balance is in contrast to slave regimes in which the African trade remained open, where males typically outnumbered females by large margins. However, the detailed state data found in table <ESW.A.2> show somewhat larger numbers of females than males in such eastern states as Georgia and South Carolina, which some have interpreted as a "division of labor" between slave exporting and slave importing states.9

Many dimensions of American slavery may be illustrated with demographic data. Table <ESW.A.1> shows the geographic shift of the slave population from the older eastern states (Virginia, North and South Carolina, and Georgia) to the newer cottongrowing states to the west (Alabama, Mississippi, Louisiana, Arkansas and Texas). Thus Mississippi's slave population increased from 17,088 in 1810 to 436,631 in 1860, while Virginia's grew only from 392,516 to 490,865 over the same period. Nonetheless, only in Maryland and Delaware could one describe the slave system as "declining" during the antebellum era. In Delaware the slave population fell continuously after 1790, so that less than 2,000 remained in 1860. In Maryland the decline was more gradual, but by 1860 the number of free blacks nearly equaled the number of slaves.

The demographic data do not tell us what fraction of this forced migration took the form of transactions in slave markets, as opposed to migration of intact plantation groups. Because these magnitudes must be estimated by indirect means, it is not surprising that quantitative historians have reached widely varying conclusions on this issue. 10 The most recent estimates suggest that the relocation was about equally divided between the two modes.¹¹

Despite the examples of Delaware and Maryland, we can say with reasonable confidence that the geographic shift in the slave population was not primarily the result of the emancipation of slaves in the eastern states, a process known as "manumission." The free black population did experience a sharp increase shortly after the Revolution, partly as the result of wartime measures by the British, and partly because the postwar ethos of freedom seemed for a time to be spreading even in the South. In Virginia, the number of free blacks grew from 12,866 in 1790 to 30,570 in 1810, while in Maryland nearly one-fourth of the black population was free by the later year (table <ESW.A.1>).

⁹ Sutch 1975. ¹⁰ Fogel and Engerman 1974, pp. 44-52; David et al 1976, pp. 99-133; Tadman 1989, pp. 25-31. ¹¹ Pritchett 2001.

Thereafter, however, the share of free blacks in the black population failed to increase, drifting downward from 13.2 percent in 1820 to 11.0 percent in 1860 (table <MRH.A.10>). Within five years of the Nat Turner slave rebellion of 1831, nearly all the southern states prohibited the freeing of slaves without legislation or court approval, frequently requiring that freed slaves leave the state. By the 1850s, Texas, Mississippi, and Georgia barred manumission altogether. When the census tabulated manumissions in 1860, they counted only 3,018 in a slave population of 4 million, or less than one per thousand (table <ESW.D.2>). By 1860, fewer than 3 percent of blacks were free in every one of the states of the Lower South (table <ESW.A.1>).

Another dimension of slave demography is the distribution of slaves among slaveholding units of various sizes. By comparison with slave systems elsewhere in the New World, ownership in the United States was widely dispersed. The 1790 census figures (not compiled until more than a century later) allow comparisons across 70 years (table <ESW.A.4>). In the face of historic changes in the geography of slavery (from southeast to southwest) and in the primary slave crops (from tobacco to cotton), the size distribution of slave holdings remained remarkably stable. Just 0.3 percent of the owners held more than 100 slaves in 1790, and by 1860 this portion had increased only to 0.6 percent. Although the mean slaveholding varied considerably from state to state - in 1850, for example, from 7.1 in Tennessee to 15 in South Carolina -- within each state the average drifted up only slowly over time. The primary cleavage in southern white society was between slaveowners and nonslaveowners. In the cotton-growing areas as of 1860, approximately one-half of the farms did not own slaves; for the South as a whole, the percentage of slaveowning families declined from 36 in 1830 to 25 in 1860.

Although slaveownership status was widely dispersed, the matter of scale looked rather different from the perspective of the slaves. Inequality of holdings was such that the "average slave" worked on a relatively large unit. In the cotton-growing areas of 1860, for example, one-third of the slaves were in holdings larger than 50.¹³

The economics of slavery

Rich statistical sources in combination with the enduring and provocative character of the subject have generated a robust and sometimes contentious literature on the economics of American slavery. Beginning with Conrad and Meyer, historical economists have attempted to resolve longstanding debates over the "profitability" of slavery, by subjecting the available data to rigorous statistical analysis in light of more precisely defined economic concepts.¹⁴ A core input for most of this research is information on the prices at which slaves were bought and sold in the major markets of the South.

Table <ESW.C.1> presents four series on the course of slave prices from the early nineteenth century until the Civil War. Series <ESW.C.1.1> is due to Ulrich Phillips, an eminent southern historian of the early twentieth century, and a pioneer in the quantitative study of slavery. 15 The series applies to "prime field hands" and was based on invoices of slave sales, but Phillips never published a precise statement of his sample or selection criterion. Subsequent researchers have concluded that the Phillips price series for New Orleans has an upward bias. Series <ESW.C.1.2>, due to Engerman, is based on a systematic sample of slave sales in New Orleans from 1804 through 1861, ranging from 2.5 to 5 percent of sales of "males aged 18 to 30, fully guaranteed as without physical or other infirmity." The third series, due to Kotlikoff, is from the same underlying source, but pertains to all males aged 21 to 38, regardless of their physical condition.16

Despite their differences, all three New Orleans series show similar trends and fluctuations across the full period: an upward surge after 1807, with periods of decline after the peaks of 1819-20 and 1837-39; from the trough in the mid-1840s, slave prices surged throughout the 1850s to all-time highs on the eve of secession (approximately \$1,500 for a prime field hand). The fluctuations generally follow swings in the business cycle, particularly British demand for American cotton. The overall trend in slave prices is strongly positive.

Following Phillips, some scholars have argued that slavery had become "unprofitable" by the end of the 1850s, because slave prices had then reached record high levels. It was pointed out very early by Yasuba and Sutch, however, that period

 ¹⁴ Conrad and Meyer 1958.
 15 Phillips 1918 and 1929.

¹⁶ Kotlikoff 1979.

fluctuations in slave prices had no particular significance for the long-term real returns to investments in slavery.¹⁷ Similar price swings had occurred twice before in the antebellum period. The deeper significance of this evidence is that slaves were priced, and slave markets were conducted, largely on the basis of expected profitability. Beginning with Conrad and Meyer, virtually all economic studies have confirmed this finding.¹⁸

Another aspect of the market-orientation of American slavery is the structure of slave prices, as opposed to the level and trend in average prices over time. An illustration of price structure is the age-sex price profile presented in table <ESW.C.2>, developed by Fogel and Engerman from data in probate records.¹⁹ The profiles display a systematic relationship between age and price, the male profile rising above the female in the late teen years, both profiles rising to peaks in the late twenties followed by decline. To be sure, these profiles are averages across many hundreds of observations; individual sale prices show considerable dispersion on either side of the line. But detailed statistical analyses show that much of the dispersion can be accounted for by observable traits of the slaves (such as skills or physical defects) or features of the transaction (such as guarantees or credit extension).²⁰

Another meaningful approach to measuring the economic returns to slave owners is to focus on the accumulation of wealth in the form of slave value. This is the objective of series <ESW.C.1.4>, the "average value of a slave" economy-wide, which adjusts the prime field hand price for the age, sex, location, and skill of the total slave population each year. In combination with annualized estimates of the slave population (series <ESW.C.1.6>), this series allowed Sutch to generate estimates of the overall growth in the stock of slave wealth (series <ESW.C.1.5>). Viewed in this way, the enrichment of the slaveowners was vast: from \$291 million in 1805 to more than \$3 billion in 1860, a ten-fold increase. Slave capital represented 44 percent of all wealth in the cotton-growing states in 1859, the largest single component.²¹

_

¹⁷ Yasuba 1961 and Sutch 1965.

¹⁸ On careful reading, this is no more than what Phillips himself argued: "Indeed the peak of this [slave] price movement was evidently cut off by the intervention of war. How great an altitude it might have reached, and what shape its downward slope might have taken had peace continued, it is idle to conjecture. But that a crash must have come is beyond a reasonable doubt" (1918, p. 375).

¹⁹ Fogel and Engerman 1974.

²⁰ Kotlikoff 1979.

²¹ Ransom and Sutch 1988, pp. 138-139.

It hardly needs saying that the high profitability of slavery to the owners did not necessarily enhance the wellbeing of the other members of the southern population. This point is clearest in the case of the slaves, who were denied both the immediate fruits of their labor and opportunities for self-advancement through the acquisition of skills and education. But nonslaveholding whites were also affected by the economics of slavery, through competition in land and product markets, and because of slavery's effects on the course of development of the regional economy. Ransom and Sutch argue that adverse economic effects were the direct consequence of the successful accumulation of wealth in the form of slave value.²² As in the standard macroeconomic model depicting the burden of public debt, the rise of slave value "crowded out" other forms of wealth in southern portfolios, reducing other forms of real capital formation. On these grounds, Ransom and Sutch attribute the South's relative lag in transportation, manufacturing, and human capital investment to the effects of capitalization of slave value.

Another developmental issue that has received academic attention is the effect of slavery on urbanization, and vice versa. Table <ESW.A.1A> presents census data on the free and slave populations of ten southern cities, from 1820 to 1860. Although the overall share of the slave population in cities was not large, a port city such as Charleston held a substantial number of slaves (12,652) as of 1820. As Mississippi River commerce grew after 1820, New Orleans became the largest slaveholding city in the country (at 23,448 in 1840). Most notably, however, the table shows that between 1820 and 1860, slaves declined as a share of the population in every one of the ten cities listed, the slave population falling absolutely in six of the ten. Richard Wade attributes the decline of urban slavery to the growing costs of maintaining the necessary discipline in an urban setting.²³ Escape was much easier than in the countryside, the communities of free blacks often providing refuge and assistance to runaways. Slaves in the cities generally had greater personal freedom, often being hired out rather than employed by their owners, sometimes even being allowed to arrange their own employment. Altogether, according to Wade, the institutional and cultural supports for slavery were being undermined in the cities of the South.

An alternative interpretation, advanced by Goldin, is that slaves were largely pulled rather than pushed out of the cities, because of the strong demand for labor in

²² Ransom and Sutch 1988.

²³ Wade 1964.

agriculture, especially during the cotton boom of the 1850s.²⁴ Because slave prices were rising in both urban and rural markets, the econometric evidence tends to support the Goldin thesis. To be sure, slavery may have required extensive restructuring if the economy of the South had shifted strongly in an urbanized direction. That such a course was feasible is indicated by the exceptional case of Richmond, whose slave population expanded even in the 1850s, because of the growth of its iron and tobacco industries based on slave labor (series <ESW.A.1A.19>).

The hypothetical course of slavery in the absence of the Civil War cannot be objectively determined with historical data alone. On the one hand, the extremely limited number of fugitive slaves recorded in 1850 and 1860 (table <ESW.D.3>) suggests that the institution was not crumbling. Although fears of slave revolts were ubiquitous in the slave South, the compilation of actual cases in table <ESW.D.4> does not point towards acceleration of rebellious activity, even as the crisis over slavery came to dominate national politics. Although this sort of evidence is undoubtedly imperfect in many ways, it is sufficient to suggest that the confidence of slaveowners in the future of their institution -- reflected in the high slave prices of 1860 -- had an objective basis.

On the other hand, by 1860 the trend of history had been towards abolition for nearly a century (table <ESW.TAB.01>), and there is reason to think that many slaves were aware of this trajectory at some level. Once the war began, plantation discipline proved very insecure whenever fighting drew near, so that slavery did indeed collapse over broad areas of the South as the Union army advanced. Thus the apparent stability of slavery in 1860 may have masked an underlying vulnerability that could not have been suppressed indefinitely, although how long it may have taken in the absence of the Civil War remains uncertain.

CHRONOLOGY

- 1761. The Philadelphia Society of Friends votes to exclude slave traders from church membership.
- 1772. Lord Chief Justice Mansfield rules that slavery is not supported by English law, thus laying the legal basis for the freeing of England's 15,000 slaves.
- 1774. The Philadelphia Society of Friends votes to adopt rules forbidding Quakers to buy or sell slaves.
- 1775. Slavery abolished in Madeira.
- 1776. The Society of Friends in England and in Pennsylvania requires members to free their slaves or face expulsion.
- 1777. The Vermont Constitution prohibits slavery.
- 1780. The Massachusetts Constitution declares that all men are free and equal by birth; a judicial decision in 1783 interprets this clause as having the force of abolishing slavery.
- 1780. Pennsylvania adopts a policy of gradual emancipation, freeing the children of all slaves born after November 1, 1780 on their twenty-eighth birthday. The "law of the free womb" is a provision contained in all other cases of gradual emancipation.
- 1784. Rhode Island and Connecticut pass gradual emancipation laws. Final ending of slavery occurs in 1842 in Rhode Island and 1848 in Connecticut.
- 1787. Formation in England of the Society for Effecting the Abolition of the Slave Trade.

- 1788. The Société des Amis des Noirs formed in France. The British Parliament passes legislation regulating the number of slaves per vessel to be carried in the slave trade.
- 1791. Slaves in St. Domingue (Haiti) rise in insurrection against the French, achieving independence in 1804.
